Pairs of spinal nerves arise from the spinal cord and leave  
the vertebral column through the intervertebral foramina.  
The central canal of the spinal cord is a remnant of the  
embryological ventricular system and is present  
throughout the whole length of the spinal cord. The spinal  
cord is supplied by a single ventral spinal artery and two  
dorsal spinal arteries.

A spinal cord segment – a portion of spinal cord that gives  
rise to a pair (right & left) of spinal nerves. Each spinal  
nerve is attached to the spinal cord by means of dorsal and  
ventral roots composed of rootlets. Spinal segments, spinal  
roots, and spinal nerves are all identified numerically by  
region, e.g., 6th cervical (C 6) spinal segment.

We used the techniques and, although very pleased with the beautiful appearance of the dendritic trees of neurones seen in the fluorescence microscope, we were again frustrated, this time by the inability of Procion Yellow to stain axons for any considerable length.

**The cytoarchitectonic organization of the spinal cord in ...**

The cytoarchitectonic organization of the rat spinal cord was found to be basically similar to that of the cat, although certain differences exist—for example, in the extension of the laminae. In addition to the laminar scheme, the distribution of certain cell groups, Lissauer's tract, and the pyramidal tract were investigated.

**Is the Spinal Cord an Organ?**

Thirty-one pairs of spinal nerves run between the vertebrae and can be divided into motor roots and sensory roots, which are located at the front and back of the spinal cord, respectively. As their names imply, these nerves are responsible for facilitating muscle movement and coordination as well as sensations throughout the body.
