[INTRODUCTION](#) Three distinct types of superoxide dismutase are known, each differing with respect to the metal at the active site (1). SOD (superoxide oxidoreductase, EC 1.15.1.1) is believed to be present in all oxygen metabolizing cells.

We discuss the two time-interval sequences which play a crucial role in studies of escape times in bistable systems driven by periodic functions embedded in noise.

A sequence can be played through an electronic musical instrument, such as an external synthesiser or software within the machine itself. In many instances, real sounds in the form of audio samples are used as an instrument.

Although the sequences are more divergent at the N-terminus, comparison of twelve GFG homologues from a variety of animal species identified a potential mitochondrial targeting signal (MTS) sequence at the N-terminus in all species examined (Fig. (Fig.3a 3a and Table Table1): 1).

The remaining sequences are  $F(q(x))$  dependent, hence increase the number of feasible sequences only by a factor of  $(MK + 1)F(q(x))$  ( $M(K + K) = 0$ ), too few to change D.H.

6. Conclusion We have determined all possible values for the asymptotic behaviour of the normalized linear complexity of multisequences. We have also given an algorithm to
