Reactive programs must be specified in terms of their ongoing behavior, and temporal logic provides an expressive and natural language for specifying this behavior. Our framework for specifying and verifying temporal properties of reactive systems is based on the following four components: 1. A computational model to describe the behavior of reactive systems. The model adopted in this book is that of a Fair Transition System (FTS).

Temporal Veri cation of Reactive Systems - Sinica Temporal formulae are interpreted over an in nite sequence of states, called a model, with respect to a position in that sequence. We will define the satisfaction relation $(\mathcal{J}) \models \varphi$ (or holds in (\mathcal{J})), as the formal semantics of a temporal formula over an in nite sequence of states $s = s_0, s_1, s_2, \dots, s_i$ and a position $i \geq 0$.

Manna-Pnueli: The Temporal Verification of Reactive Systems: Progress In our preceding books, we discussed methods for proving safety properties. While the class of safety properties is important, and normally occupies a large portion of a specification, it must be complemented by properties in the other classes.
