Transcranial Doppler sonography is a noninvasive technique that uses a 2-MHz, pulsed Doppler transducer to measure the velocity of blood flow within the circle of Willis and vertebrobasilar system through regions of temporal calvarial thinning or through the orbits or foramen magnum. By using

Transcranial Doppler sonography (TCD) is one brain imaging supplement or surrogate for the field of neuroergonomics. Although its ability to provide detailed information about specific brain loci is limited in comparison to the other imaging procedures, TCD offers good temporal resolution and, compared to the other procedures, it can track

Transcranial Doppler sonography (TCD) was first introduced by Rune Aaslid and colleagues in 1982 to non-invasively measure blood flow velocities in the major branches of the Circle of Willis through the intact skull. 1 A 2-MHz frequency pulse wave ultrasonic beam penetrates the skull and allows returned echo signals to be detected.
