Uniform Spaces and Measures addresses the need for an accessible and comprehensive exposition of the theory of uniform measures -- a need that became more critical when uniform measures recently reemerged in new results in abstract harmonic analysis.

Uniform space - Encyclopedia of Mathematics

Any uniform space $(X, \mathcal{F}, \mathcal{A})$ can be uniformly imbedded as an everywhere-dense subset in a unique (up to a uniform isomorphism) complete uniform space $(\tilde{X}, \tilde{\mathcal{F}}, \tilde{\mathcal{A}})$, which is called the completion of $(X, \mathcal{F}, \mathcal{A})$. The topology of the completion $(\tilde{X}, \tilde{\mathcal{F}}, \tilde{\mathcal{A}})$ of a uniform space $(X, \mathcal{F}, \mathcal{A})$ is compact if and only if \mathcal{F}, \mathcal{A} is a pre-compact uniformity (that is, such that any UNIFORM SPACES AND Measures Jan Pachl - EUR 119,99 ...

Uniform measures are certain functionals on the space of bounded uniformly continuous functions on a uniform space. They are a common generalization of several classes of measures and measure-like functionals studied in abstract and topological measure theory, probability theory, and abstract harmonic analysis. They offer a natural framework for results about topologies on spaces of measures.

Can I Have Some More Examples Of Uniform Spaces Please?

I have been reading about uniform spaces and topological groups. There does not look to be a lot of literature on the topic, much less accesible literature, and the books that I have been reading do not mention any examples of uniform spaces, other than metric spaces and topological groups.

Metric space vs Uniform space vs Topological Space

Hence, every metric space carries a canonical uniformity induced by its metric, but not vice versa. Some uniform spaces are "too big" to carry a metric, recall that there are arbitrary products of uniform spaces, the product $[0,1]^{[0,1]}$ cannot carry a metric, as its topology is not first countable, but it carries the product uniformity.

Uniform space - Wikipedia

In the mathematical field of topology, a uniform space is a set with a uniform structure. Uniform spaces are topological spaces with additional structure that is used to define uniform properties such as completeness, uniform continuity and uniform convergence.

Expansivity for measures on uniform spaces | Request PDF

We define positively expansive and expansive measures on uniform spaces extending the analogous concepts on metric spaces. We show that such measures can exist for measurable or bimeasurable maps.

uniform space in nLab - ncatlab.org

Every uniform space also has an underlying proximity (defined there), and the resulting functor $\text{Unif Prox} \rightarrow \text{Unif}$ has a fully faithful right adjoint which identifies proximity spaces with uniform spaces that are totally bounded.

Uniform spaces play the same role for uniform continuity

as topological spaces for continuity. The theory was created in 1936 by A. Weil, whose original axiomatization was soon followed by those of Bourbaki and Tukey; in this book use is made chiefly of Tukey's system, based on uniform coverings.
