This monograph deals with the application of the method of the extremal metric to the theory of univalent functions. Apart from an introductory chapter in which a brief survey of the development of this theory is given there is therefore no attempt to follow up other methods of treatment. Multivalent function); and in particular -valent functions, are a generalization of univalent functions. In the study of univalent functions one of the fundamental problems is whether there exists a univalent mapping from a given domain onto a given domain.

In the theory and application of conformal mappings in the plane the principal question is that of the possibility of mapping a given domain onto another by a univalent conformal mapping, and in practical applications, the question of the possibility of achieving this using relatively simple functions.
